Client Folder Structure – Introduction

The **client** folder represents the **frontend** of the **Online Complaint Registration System**, developed using **React.js**. It provides an interactive and responsive user interface through which users, agents, and administrators can access the system. The frontend communicates with the backend using REST APIs to perform operations such as user authentication, complaint registration, complaint tracking, feedback submission, and notification management.

The client-side application is organized into separate folders for reusable components, pages, stylesheets, images, services, and context management. This modular structure improves code readability, maintainability, and scalability while following React best practices.
