

Working of MVC Pattern

1. The **User** sends an HTTP request through the frontend.
2. The request reaches the **Routes (View Layer)**.
3. The Routes forward the request to the appropriate **Controller**.
4. The Controller validates the request and processes the business logic.
5. The Controller calls the required **Model**.
6. The Model performs CRUD operations on **MongoDB**.
7. MongoDB returns the requested data to the Model.
8. The Model sends the data back to the Controller.
9. The Controller prepares the response and sends it through the Routes.
10. The User receives the final response.
