

PROJECT SETUP AND CONFIGURATION

Client Setup (Installing React Application)

Story

Frontend Setup for the Online Complaint Registration Management System

Estimated Duration: 10 Minutes

Description

The frontend of the **Online Complaint Registration Management System** is developed using **React.js** with **Vite**, providing a fast development environment, hot module replacement (HMR), and improved performance. Follow the steps below to create and run the frontend application.

Step 1: Open the Frontend Folder

Open **Visual Studio Code**.

Launch the integrated terminal.

Navigate to the project directory where the **client** (frontend) folder is located or where it will be created.

Step 2: Create a React Application

Execute the following command:

```
npm create vite@latest . -- --template react
```

Explanation

- `npm create vite@latest` creates a new Vite project.
 - `.` creates the project in the current directory.
 - `--template react` selects React as the frontend framework.
-

Step 3: Select the Framework

When prompted by Vite, select:

React

Step 4: Select the Variant

Choose the programming language:

JavaScript

Step 5: Navigate to the Client Folder

If necessary, move into the frontend directory:

`cd client`

Step 6: Install Project Dependencies

Install all required packages:

`npm install`

This command downloads all required libraries, creates the **node_modules** folder, and prepares the project for development.

Step 7: Install Additional Packages

Install the commonly used libraries for the Online Complaint Registration Management System.

```
npm install react-router-dom axios
```

These packages are used for:

- Page Navigation
 - API Communication
 - Authentication
 - Complaint Management
-

Step 8: Start the Development Server

Run:

```
npm run dev
```

After successful execution, Vite displays:

VITE ready

Local:

<http://localhost:5173/>

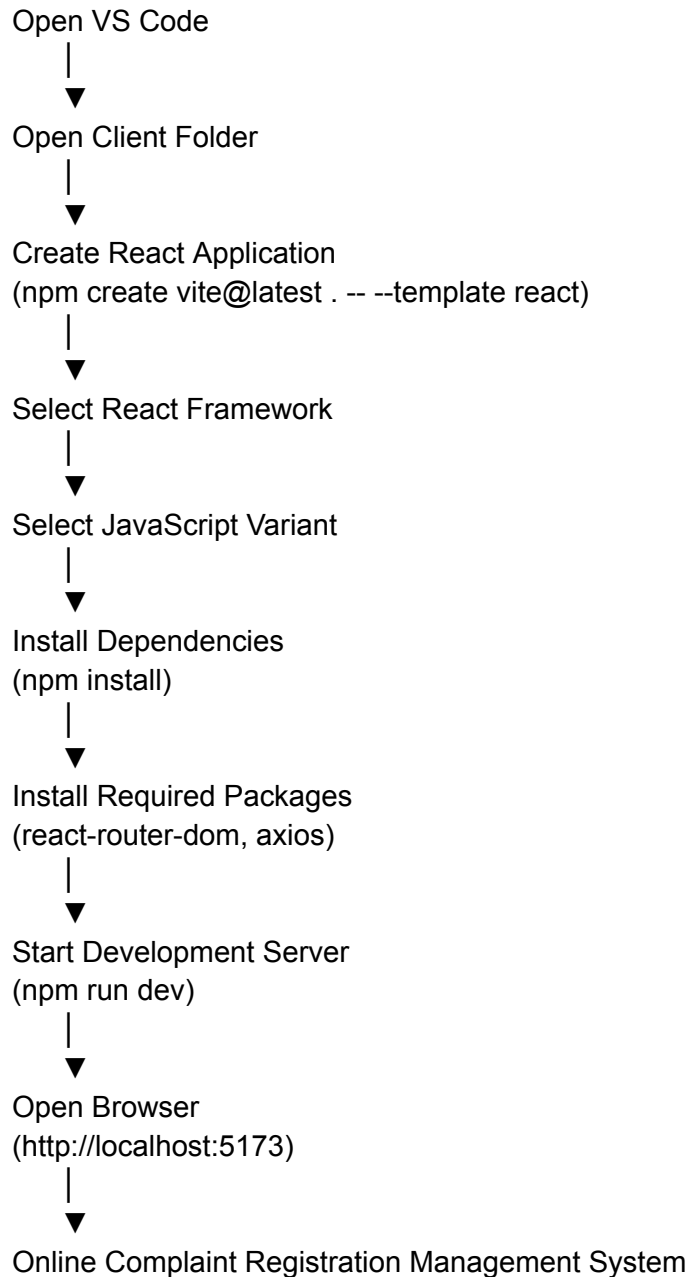

Step 9: Open the Application

Open the following URL in your browser:

<http://localhost:5173>

The **Online Complaint Registration Management System** homepage will be displayed successfully.

Frontend Setup Workflow

Frontend Setup Summary

Step	Action	Command / Selection
------	--------	---------------------

1	Open Client Folder	Open VS Code and navigate to the client directory
2	Create React Application	<code>npm create vite@latest . -- --template react</code>
3	Select Framework	React
4	Select Variant	JavaScript
5	Navigate to Client Folder	<code>cd client</code>
6	Install Dependencies	<code>npm install</code>
7	Install Additional Packages	<code>npm install react-router-dom axios</code>
8	Start Development Server	<code>npm run dev</code>
9	Open Application	<code>http://localhost:5173</code>

Expected Outcome

After completing the above steps, the frontend of the **Online Complaint Registration Management System** will be successfully configured and running. The application is now ready for implementing modules such as User Registration, Login, Complaint Submission, Complaint Tracking, Officer Dashboard, and Admin Dashboard.
